

DM814x EZ 5.03 Software Developers Guide

Welcome to the DM814x EZ Software Developer's Guide

Thanks you for choosing the DM814x Evaluation Module (EVM) for your application. The purpose of this guide is to get you going with developing software for the DM814x on a Linux development host only.

Note! This Software Developer's Guide (SDG) supports version 5.03 of the DM814x EZSDK which is only for Linux host development.

Note! This guide assumes you have already followed the Quick Start Guide (QSG) for setting up your EVM and installing the Easy Software Development Kit (EZ SDK). If you have not done this yet, please do so now before continuing. You can find a hard copy contained with your EVM. Alternatively you can find the QSG PDF and various other documentation in the 'docs' directory of the EZSDK installation directory.

Note! All instructions in this guide are for Ubuntu 10.04 LTS ^[1]. At this time, it is the only supported Linux host distribution for development.

Note! In previous DVSDK releases there has been a *Getting Started Guide* explaining how to set up the DVSDK. This document replaces and extends the Getting Started Guide for DVSDK 3.xx and is a new document in the EZSDK superseding the *Getting Started Guide*.

Throughout this document there will be commands spelled out to execute. Some are to be executed on the Linux development host, some on the Linux target and some on the u-boot (bootloader) prompt. They are distinguished by different command prompts as follows:

```
host $ <this command is to be executed on the host>
target # <this command is to be executed on the target>
u-boot :> <this command is to be executed on the u-boot prompt>
```

Starting your software development

Your EZ SDK should be installed before you continue. Throughout this document it will be assumed you have an environment variable *EZSDK* which points to where your EZ SDK is installed. You can set it as follows (the following assumes that EZ SDK was installed at default location):

```
host $ export EZSDK="${HOME}/ti-ezsdk_dm814x-evm_xx_xx_xx_xx"
```

Setting up the EZ SDK

You will need an ARM Linux development environment, in case you do not have one please refer to this link to see how to set one up.

Configuration of ARM Linux development Environment ^[2]

Please get the Code Sourcery tools that will be the compiler for the ARM Linux applications.

Code Sourcery Tools Download ^[3]

The EZ SDK comes with a script for setting up your Ubuntu 10.04 LTS development host as well as your target boot environment. It is an interactive script, but if you accept the defaults by pressing return you will use the recommended settings. This is recommended for first time users. Note that this script requires ethernet access as it will update your Ubuntu Linux development host with the packages required to develop using the EZ SDK. Execute the script using:

```
host $ ${EZSDK}/setup.sh
```

If you accepted the defaults during the setup process, you will now have set up your development host and target to:

1. Boot the Linux kernel from your development host using TFTP. On your development host the Linux kernel is fetched from */tftpboot* by default.
2. Boot the Linux file system from your development host using NFS. On your development host the Linux target file system is located at */\${HOME}/targetfs*
3. Minicom is set up to communicate with the target over RS-232. If you want to use a windows host for connecting to the target instead, see the *#Setting_up_Tera_Term* section.

Note! To boot the board from NFS, you may need to change the boot switch settings on your EVM. Please refer the UBoot user guide in the board-support/docs folder for more information on the switch settings.

If you start minicom on your Linux development host using *minicom -w* (or Tera Term on Windows) and power cycle the EVM, Linux will boot.

After Linux boots up, login into the target using **root** as the login name.

Note! The Matrix application launcher is launched automatically. If you exit from Matrix and if you would like to start it again, execute the following command on the target board:

```
target # /etc/init.d/matrix-gui-e start
```

If your kit includes an LCD display, the first time the Matrix GUI is executed, you'll go through a LCD touchscreen calibration process. The calibration process is important as other application in addition to the Matrix GUI require calibration to run successfully. You can also run the calibration manually without starting the Matrix GUI by executing the following command on the target board:

```
target # ln -s /dev/input/event0 /dev/input/touchscreen0
target # ts_calibrate
```

Make sure you have terminated the Matrix before running any other applications from the command line:

```
target # /etc/init.d/matrix-gui-e stop
```

Writing your own "Hello World!" application and executing it on the target

This section shows how to create/build an application on your host development PC and execute a basic Linux application on your booted target filesystem.

1. Create your own work directory on the host PC and enter it:

```
host $ mkdir ${HOME}/workdir
host $ cd ${HOME}/workdir
```

2. Create a new C source file:

```
host $ gedit helloworld.c
```

Enter the following source code:

```
#include <stdio.h>

int main()
{
    printf("Hello World!\n");
}
```

Save the file and exit.

3. Create a basic makefile:

```
host $ gedit Makefile
```

Enter the following:

```
# Import the variables from the EZSDK so that you can find the EZSDK components
include ${EZSDK}/Rules.make

helloworld:
# Make sure that you use a tab below
$(CSTOOL_PREFIX)gcc -o helloworld helloworld.c
```

Save the file and exit. Note that the gap before `$(CSTOOL_PREFIX)gcc` corresponds to a tab. If it is filled with spaces instead you will get build errors.

4. Make sure the `$EZSDK` variable is still set using:

```
host $ echo $EZSDK
```

This command should print your EZSDK installation directory. If it doesn't, you will have to set it again as described in the beginning of this document. Compile the application:

```
host $ make helloworld
```

As a result, an executable called `helloworld` is generated in `${HOME}/workdir`

5. You now have your own application, but you need to create a directory and copy it to your NFS exported filesystem to make it visible by the target:

```
host $ mkdir ${HOME}/targetfs/home/root/dm814x
host $ cp helloworld ${HOME}/targetfs/home/root/dm814x
```

6. On your target this application will be accessible from `/home/root/dm814x/helloworld`. Execute it on your target:

```
target # /home/root/dm814x/helloworld
```

You should now see the following output:

```
Hello World!
```

Congratulations! You now have your own basic application running on the target.

Running the pre-installed applications on the target file system

The filesystem comes with a number of prebuilt applications (which can be rebuilt inside the EZSDK). This section shows how to execute those applications in the provided filesystem.

Before running these ensure that Matrix application is not running. This can be done by executing the following command in the serial terminal.

```
target # /etc/init.d/matrix-gui-e stop
```

If you wish to restart the Matrix application at a later time, you can execute the following command.

```
target # /etc/init.d/matrix-gui-e start
```

Running the DaVinci demo examples

The EZSDK comes with example applications.

For DaVinci multimedia, you can use OMTB to run different OpenMAX IL chains. OMTB is the OpenMax Test Bench which is a command-line utility used for validating OpenMax.

Running OMTB

Note: In order to see the video output, the graphics planes need to be turned off. For more information on the graphics planes and their sysfs entries, please read the VPSS guide in PSP documentation.

Turn off the Graphics Plane 0 by running the following command.

```
target # echo 0 > /sys/devices/platform/vpss/graphics0/enabled
```

In case Graphics Planes 1 and 2 are currently open, then they need to be disabled as well.

```
target # echo 0 > /sys/devices/platform/vpss/graphics1/enabled
target # echo 0 > /sys/devices/platform/vpss/graphics2/enabled
```

Execute the following commands to run OMTB.

```
target # cd /usr/share/ti/ti-omtb
target # ./omtb_<platform>_a8host.xv5T <script-name>.oms
```

For more information on OMTB and how to construct OpenMAX IL chains please refer the OMX and OMTB documentation.

Note: OMTB will require a script to run and should not be called without a valid script as an argument.

Note: You will need to turn the graphics planes back on if you wish to run any Graphics applications. You will also need to revert the change to /etc/init.d/load-hd-firmware.sh in case you wish to see the video demo from the Matrix Application Launcher.

Note: The dual_display_encode_decode.oms script will pause within a couple of seconds. This script is designed to work from matrix and hence has this pause functionality built in. A script which does not pause is also present and can be used instead.

Running the SysLink examples

The SysLink comes with a few sample applications. To run the sample applications such as "MessageQ" use the below set of commands.

Note! The syslink samples use a different memory map from the default EZSDK installation. In order to run syslink examples, you must boot with a different memory for linux. When booting, ensure that the linux bootargs is changed from the default values to **MEM=169M**

Note! The syslink samples cannot be run out with graphics or firmware loaded. Please execute the following steps to teardown the graphics plane and ensure that no firmware is running.

```
target # /etc/init.d/pvr-init stop
target # /etc/init.d/matrix-gui-e stop
target # /etc/init.d/load-hd-firmware.sh stop
```

Now the system is ready to run all syslink samples.

```
target # modprobe syslink
target # cd /usr/share/ti/syslink-examples/TI814X
```

Execute the following script to run the example application

```
target # ./runsamples_debug.sh
```

The target terminal window will output the results of the examples executed.

Please refer to the syslink documentation in component-sources/syslink_x_xx_xx_xx/docs to experiment on these examples and for further information on how to change the memory map.

Running the Codec Engine examples

The Codec Engine package comes with a small set of examples.

Note! The syslink samples use a different memory map from the default EZSDK installation. In order to run syslink examples, you must boot with a different memory for linux. When booting, ensure that the linux bootargs is changed from the default values to **MEM=169M**

Note! The Codec Engine examples cannot be run out with graphics. Please execute the following steps to teardown the graphics plane and ensure that no firmware is running.

```
target # /etc/init.d/pvr-init stop
target # /etc/init.d/matrix-gui-e stop
target # /etc/init.d/load-hd-firmware.sh stop
```

***TODO:** Which steps are necessary to get firmware started by load-hd-firmware.sh running parallel to Codex Engine examples...*

To run the application, enter the following set of commands on the target:

```
target # cd /usr/share/ti/ti-codec-engine-examples
```

Ensure that syslink and cmem modules are installed with memory configuration as below

```
target # modprobe syslink
target # modprobe cmemk phys_start=0x94000000 phys_end=0x947fffff \
pools=20x4096,10x131072,2x1048576
```

To run the audio1_copy example, you will need to run the following commands.

```
target # cd audio1_copy
target # ./app_remote.xv5T
```

To run other examples, please refer the Codec Engine documentation.

Running the Qt/Embedded examples

The Qt embedded comes with some examples applications. To see the examples that are available, check out this directory on the target:

```
target # cd /usr/bin/qtopia/examples
target # ls
```

Execute the following command to run Qt/e calendar example application.

Note! - You should quit the Matrix GUI application before running Qt/Embedded examples. You will need to export additional touchscreen related variables.

```
target # export TSLIB_TSDEVICE=/dev/input/event0
target # export QWS_MOUSE_PROTO="Tslib:/dev/input/event0 Auto:/dev/input/mice"

target # cd /usr/bin/qtopia/examples/richtext/calendar
target # ./calendar -qws -geometry 320x200+50+20
```

After you see the calendar interface, hit *CTRL-C* to terminate it

QT Examples with SGX Acceleration please see QT Tips on TI Processors Wiki ^[4]

Running the Graphics SDK examples

The Graphics SDK comes with some examples applications. To see the examples that are available, check out this directory on the target:

```
target # cd /usr/bin/SGX/demos/Raw
target # ls
```

Here is the list of apps you will see:

OGLES2ChameleonMan OGLESEvilSkull OGLESPolyBump
OGLES2Coverflow OGLESFilmTV OGLESShadowTechniques
OGLES2FilmTV OGLESFiveSpheres OGLESSkybox
OGLES2PhantomMask OGLESFur OGLESTrilinear
OGLES2Shaders OGLESLighting OGLESUserClipPlanes
OGLES2Skybox2 OGLESMouse OGLESVase
OGLES2Water OGLESOptimizeMesh
OGLESCoverflow OGLESParticles

Execute the following command to run 3D Graphics application, this particular example is for an album coverflow.

```
target # ./OGLES2Coverflow
```

After you see the output on the display interface, hit *q* to terminate it

Using the devkits

At the top level directory of the EZSDK you will find one or more devkits, typically *linux-devkit* and *dsp-devkit*. The devkits are:

1. The tools, libraries and headers to develop applications for a specific hardware subsystem (e.g. the arm or the dsp).
2. The devkits are relocatable, meaning you can move them to another location on your filesystem and they will still work (see [[#Moving_the_devkits](#)] [#Moving the devkits](#)] below).
3. The devkits do **not** contain source code or build files. If you want to change components, or make a change to a component, the devkit will need to be regenerated, see [[#Regenerating_the_devkits](#)] [#Regenerating the devkits](#)] below.
4. The devkits contain the documentation of the TI components in one location.

The devkits were introduced to provide a more unified view of what is available for each hardware subsystem and present a system view of the software in the EZSDK as opposed to a component view. Since they are relocatable, they are also easier for a user to check in to version control.

Note! The components themselves are still available from the `${EZSDK}/component-sources` directory, and the `${EZSDK}/Rules.make` file still points to all the right component directories. If you do not wish to build against the devkits, but directly against the components, this is still possible.

Regenerating the devkits

You may need to regenerate the devkit because you changed a component version, in which case you (Codec Engine example):

1. Download the new Codec Engine release from the web.
2. Read the release notes to make sure all dependencies are satisfied, or you may have to update more components.
3. Extract the downloaded release on your target filesystem, and update the `CE_INSTALL_DIR` variable in `${EZSDK}/Rules.make` to point to the new location.
4. Enter the `${EZSDK}` directory.
5. Clean the EZSDK by executing `make clean` so that files not relevant to your target (linux, dsp etc.) don't get copied.
6. Make sure the components are compiled for Linux by executing `make components_linux`.
7. Execute `make linux-devkit` to populate the linux-devkit with the TI components.
8. Clean the EZSDK by executing `make clean`.
9. Make sure the components are compiled for the DSP by executing `make components_dsp`.
10. Execute `make dsp-devkit` to populate the dsp-devkit with the TI components.

If you have modified a component, in which case the support TI will be able to provide is limited, you can regenerate the devkits using only the last 7 steps above.

Note that not all components contribute to all devkits. You may only have to regenerate e.g. the dsp-devkit if you update or change sysbios.

Verifying the devkit integrity

When the devkits are created, two files are generated at the devkit's top level directory:

1. `install.log` contains the TI components and versions used in the devkit.
2. `md5sums` contains the md5sums of all files in the devkit.

In addition, the `${EZSDK}/docs` directory contains the md5sums of the devkits at the time of release.

If a file has been changed, or a component updated, the md5sums will have changed. To verify whether this is the case for e.g. the dsp-devkit, enter the dsp-devkit directory and execute:

```
host $ md5sum -c ${EZSDK}/docs/dsp-devkit.md5sums | grep -v OK$
```

If there is no output from this command, your integrity with the devkit released by TI is ok. If there is an error, the offending files will be printed.

Moving the devkits

The devkits are relocatable, whereas the rest of the EZSDK is not. This means that you can put the devkits in any directory on your Linux filesystem, as long as you do the following (dsp-devkit example):

1. If you want to be able to regenerate the dsp-devkit (see [#Regenerating_the_devkits #Regenerating the devkits], you'll need to update the *DSP_DEVKIT_DIR* variable in *\$(EZSDK)/Rules.make*.
2. Before building against the dsp-devkit from the command line, you need to "source" the environment-setup script (don't forget the .):

```
host $ . /path/to/dsp-devkit/environment-setup
```

Note! For the linux-devkit you will currently have to edit the first line of *\$(EZSDK)/linux-devkit/environment-setup* to change the *SDK_PATH* variable to point to your new location. You can get your new location by executing the following in the linux-devkit directory:

```
host $ pwd
```

Note! The dsp-devkit does not contain xdctools. If you need to relocate the devkit, the path to xdctools needs to be updated in dsp-devkit/environment-setup.

EZSDK software overview

[/index.php/File:Dm814x_am387x_software_overview.jpg]

Overview of the EZ SDK Software stack

The EZ SDK contains many software components. Some are developed by Texas Instruments and some are developed in and by the open source community(White). TI contributes, and sometimes even maintains, some of these open source community projects, but the support model is different from a project developed solely by TI.

Creating a Linux application

[/index.php/File:C6a816x_am389x_psp_overview.jpg]

]

Overview of a basic Linux application component usage

While creating a basic Linux application you are typically using the following components of the stack (the rest are greyed out above):

Component	Purpose in this application	Location in the EZSDK
CodeSourcery GCC toolchain	Cross compiler for generating ARM Linux binaries.	User specified location outside the EZSDK
Open Source Linux libraries	Provides libraries such as libpng, libusb, libz, libcurl etc.	linux-devkit/arm-none-linux-gnueabi/lib and linux-devkit/arm-none-linux-gnueabi/usr/lib/
Platform Support Package	Provides device drivers for the EVM and documentation and examples to support them.	board-support
Linux kernel	The Linux kernel with the PSP device drivers	board-support/linux-kernel-source

You can find examples all over the web on how to write this type of application. The PSP examples are a good reference on how to access the peripheral drivers specific to this platform.

Creating a SYS/Link application

[/index.php/File:C6a816x_am389x_syslink_overview.jpg

]

Overview of a SYSLink application component usage

SYS/Link(SysLink) is foundation software for the inter-processor communication across the HLOS-RTOS boundary. It provides a generic API that abstracts the characteristics of the physical link connecting HLOS and RTOS from the applications. It eliminates the need for customers to develop such link from scratch and allows them to focus more on application development.

SysLink provides several features and capabilities that make it easier and more convenient for developers using a multi-core system:

- Provides a generic API interface to applications
- Hides platform/hardware specific details from applications

- Hides HLOS operating system specific details from applications, otherwise needed for talking to the hardware (e.g. interrupt services)
- Applications written on SysLink for one platform can directly work on other platforms/OS combinations requiring no or minor changes in application code
- Makes applications portable
- Allows flexibility to applications of choosing and using the most appropriate high/low level protocol
- Provides scalability to the applications in choosing only required modules from SysLink.

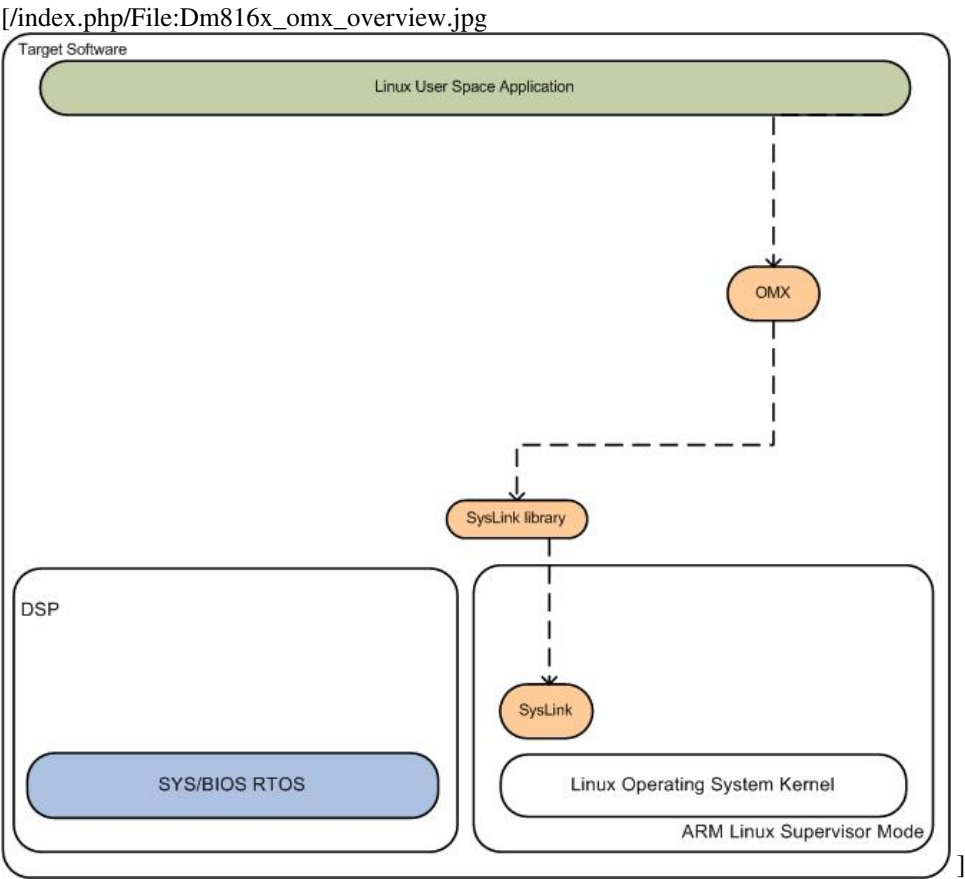

In addition to the components used for the basic Linux app, these are used (and the rest is greyed out in the diagram above):

Component	Purpose in this application	Location in the EZSDK
SYS/BIOS	Real-Time Operation System for TI DSPs	component-sources/sysbios_x_xx_xx_xx
SysLink	HLOS to RTOS communication link for passing messages and data in multiprocessor systems	component-sources/syslink_x_xx_xx_xx
IPC	RTOS communication link for passing messages and data communication	component-sources/ipc_x_xx_xx_xx
Platform Support Package	Provides device drivers for the EVM and documentation and examples to support them	board-support
C6000 Code Generation Tools	TI DSP code generation tools	dsp-devkit/cgt6x_x_x_xx

Good application examples to start from include:

- The sample applications (component-sources/syslink_x_xx_xx_xx/packages/ti/syslink/samples provide simpler and smaller examples on how to use SysLink.

Creating an OpenMax IL application

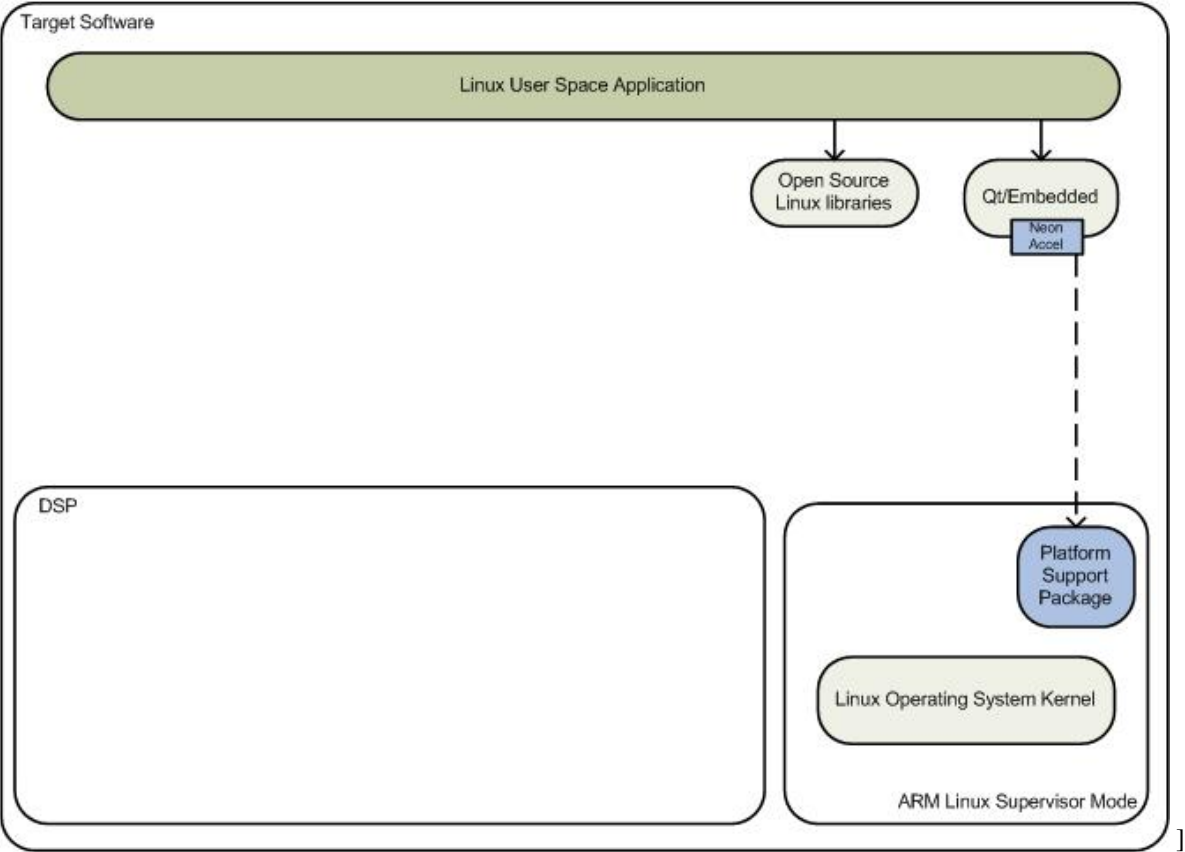

Overview of a basic OMX application component usage

The OpenMax IL package wraps key Multimedia functions which can be invoked from the ARM side using simple API calls. In addition to the components used for the Linux app, these are used (and the rest is greyed out in the diagram above):

Component	Purpose in this application	Location in the EZSDK
OpenMax	OpenMax IL multimedia framework for the applications invoking multimedia codecs and other algorithms.	component-sources/omx_xx_xx_xx_xx
SysLink	HLOS to RTOS communication link for passing messages and data in multiprocessor systems	component-sources/syslink_x_xx_xx_xx

Creating a Qt/Embedded application

[/index.php/File:C6a816x_am389x_qt_overview.jpg

Overview of a Qt/Embedded application component usage

Qt/Embedded is a Graphical User Interface toolkit for rendering graphics to the Linux framebuffer device, and is included in this kit. The base Qt toolkit on the other hand renders the graphics to the X11 graphical user interface instead of to the basic framebuffer.

In addition to the components used for the basic Linux app, these are used (and the rest is greyed out in the diagram above):

Component	Purpose in this application	Location in the EZ SDK
Qt/Embedded	Provides a Graphical User Interface toolkit	linux-devkit/arm-none-linux-gnueabi/usr/lib/libQt*
SysLink	HLOS communication link for passing messages and data in multiprocessor systems	component-sources/syslink_x_xx_xx_xx
Platform Support Package	Provides device drivers for the EVM and documentation and examples to support them.	board-support

See the Qt Reference Documentation ^[5] on various API's and its usages. You can also download some Qt/e example applications from Qt Examples ^[6] web page.

Compiling an application

EZ SDK Linux development kit includes the Qt/Embedded host tools and development header and libraries.

1. First, configure your cross compilation environment #Setting_up_cross_compilation_environment.
2. Next, follow the typical Qt/e recommended method for cross compiling your application on host.

```
host $ cd <directory where your application is>
host $ qmake -project
```

```
host $ qmake
host $ make
```

Matrix User's Guide

Please refer to the The Matrix User's Guide ^[7] for more information.

Additional Procedures

Setting up cross compilation environment

To enable your application development, EZ SDK comes with linux-devkit which contains package header, libraries and other package dependent information needed during development. Execute the following commands to configure your cross compilation environment

```
host $ source ${EZSDK}/linux-devkit/environment-setup
```

The above command will export cross compilation specific environment variables.

You will notice that the command will add **[linux-devkit]** to your bash prompt to indicate that you have exported the required cross compiler variables.

Modifying the EZSDK Memory Map

By Default, the EZSDK Ships with a memory map that is configured for 1GB of DDR. More details on how to configure the memory map to different memory sizes or to even change the partitioning is available on TI's Processor Wiki at http://processors.wiki.ti.com/index.php/EZSDK_Memory_Map.

Rebuilding the EZ SDK components

The EZ SDK has provided a top level Makefile to allow the re-building of the various components within the EZSDK.

Note: The EZ SDK component build environment is self contained and doesn't require the #Setting_up_cross_compilation_environment thus should be avoided to prevent possible build failures.

Rebuild the EZSDK components by first entering the EZ SDK directory using:

```
host $ cd ${EZSDK}
```

The EZ SDK makefile has a number of build targets which allows you to rebuild the EZSDK components. For a complete list execute:

```
host $ make help
```

Some of the components delivered in the EZ SDK are not pre-built. The provided 'make clean' & 'make components' build targets are designed to clean and build all components (e.g. Linux Kernel, CMEM, DMAI, etc.) for which a build is compulsory to begin application development. These components must first be cleaned and then rebuilt by the user before the user attempts to rebuild anything else. To do this, simply run

```
host $ make clean
host $ make components
```

After that, each of the build targets listed by 'make help' can then be executed using:

```
host $ make <target>_clean
host $ make <target>
host $ make <target>_install
```

In order to install the resulting binaries on your target, execute one of the "install" targets. Where the binaries are copied is controlled by the `EXEC_DIR` variable in `${EZSDK}/Rules.make`. This variable is set up to point to your NFS mounted target file system when you executed the EZ SDK setup (`setup.sh`) script, but can be manually changed to fit your needs.

You can remove all components generated files at any time using:

```
host $ make clean
```

And you can rebuild all components using:

```
host $ make all
```

You can then install all the resulting target files using:

```
host $ make install
```

Creating your own Linux kernel image

The pre-built Linux kernel image (uImage) provided with the EZSDK is compiled with a default configuration. You may want to change this configuration for your application, or even alter the kernel source itself. This section shows you how to recompile the Linux kernel provided with the EZSDK, and shows you how to boot it instead of the default Linux kernel image.

1. If you haven't already done so, follow the instructions in `#Setting_up_the_EZ_SDK` to setup your build environment.
2. Recompile the kernel provided with the EZSDK by executing the following:

```
host $ cd ${EZSDK}
host $ make linux_clean
host $ make linux
host $ make linux_install
```

3. You will need a way for the boot loader (u-boot) to be able to reach your new uImage. TFTP server has been setup in the `#Setting_up_the_EZ_SDK` section.

4. Copy your new uImage from the `EXEC_DIR` specified in the file `${EZSDK}/Rules.make` to the tftpserver:

```
host $ cp ${HOME}/targetfs/home/root/dm814x/boot/uImage /tftpboot
```

5. Copy the exported Linux kernel modules from the `EXEC_DIR` to the `/lib/modules` directory:

```
host $ sudo cp -r ${HOME}/targetfs/lib/modules ${HOME}/targetfs/lib/modules_original
host $ sudo cp -r ${HOME}/targetfs/home/root/dm814x/lib/modules ${HOME}/targetfs/lib
```

6. Run the u-boot script and follow the instructions. Select TFTP as your Linux kernel location and the file 'uImage' as your kernel image.

```
host $ ${EZSDK}/bin/setup-uboot-env.sh
```

Note! In this release of the EZ SDK, U-Boot does not read the MAC Address from eFuses. As a result the ethernet MAC Address needs to be set manually by choosing a valid random MAC Address. More details are available in the PSP U-Boot documentation. Please run the following command to set the ethernet MAC Address

```
u-boot :> set ethaddr <value of the MAC address chosen>
```

7. Note that when you change your kernel, it is important to rebuild the kernel modules supplied by the EZSDK sub-components. You can find a list of these modules under the directory `/lib/modules/2.6.32-rc2-davinci1/kernel/drivers/dsp/` (replace `2.6.32-rc2-davinci1` with the version of the kernel applicable to your platform)

```
host $ ls ${HOME}/targetfs/lib/modules/2.6.32-rc2-davinci1/kernel/drivers/dsp/
```

For each module that you see listed, you should go back to the host, rebuild it, and replace the file with the one from your EXEC_DIR. E.g. for `cmemk.ko`

```
host $ cd ${EZSDK}
host $ make cmem_clean
host $ make cmem
host $ make cmem_install
host $ sudo mv ${HOME}/targetfs/lib/modules/2.6.32-rc2-davinci1/kernel/drivers/dsp/cmemk.ko \
${HOME}/targetfs/lib/modules/2.6.32-rc2-davinci1/kernel/drivers/dsp/cmemk.ko.orig
host $ sudo cp ${HOME}/targetfs/home/root/dm814x/cmem/cmemk.ko \
${HOME}/targetfs/lib/modules/2.6.32-rc2-davinci1/kernel/drivers/dsp
```

8. After updating all modules, start minicom or Tera Term and power-cycle the board. The new kernel will now be loaded over TFTP from your Linux host.

Setting up Tera Term

Tera Term is a commonly used terminal program on Windows. If you prefer to use it instead of Minicom, you can follow these steps to set it up.

1. Download Tera Term from this location ^[8], and start the application.
2. In the menu select *Setup->General...* and set:

```
Default port: COM1
```

3. In the menu select *Setup->Serial Port...* and set the following:

```
Port:          COM1
Baud rate:     115200
Data:          8 bits
Parity:        none
Stop:          1 bit
Flow control:  none
```

NOTE: *Kernel Bootargs can be generated by running the setup script. See the section #Setting_up_the_EZ_SDK for details on running the setup script.*

How to create an SD card

This section explained the procedure required for creating SD card image for DM814x and the steps has been verified on 2GB, 4GB and 8GB SD cards.

1. Plug an SD card on Linux host machine.
2. Run dmesg command to check the device node. Triple check this to ensure you do not damage your HDD contents!

```
host $ dmesg
[14365.272631] sd 6:0:0:1: [sdb] 3862528 512-byte logical blocks: (1.97 GB/1.84 GiB)
[14365.310602] sd 6:0:0:1: [sdb] Assuming drive cache: write through
[14365.325542] sd 6:0:0:1: [sdb] Assuming drive cache: write through
[14365.325571] sdb: sdb1 sdb2
```

In this example, SD card is detected on /dev/sdb.

3. Run mkksdboot script installed in EZ SDK as show below

```
host $ sudo ${EZSDK}/bin/mkksdboot.sh --device /dev/sdb --sdk ${EZSDK}
```

Wait for script to complete. On successful completion, remove the SD card from the host PC.

4. Power OFF the DM814x EVM.
5. Set the SW1 switch to boot from SD.
 - SW1 = 000001010111 (high to low, i.e. SW1.1 = 1)
 - 1 = "On" position on the switch
6. Insert the SD card into the DM814x EVM.
7. Power ON the EVM.

Note! If your flash already has a u-boot environment stored, this will get picked up even while booting from SD-card. If this is the case, halt the u-boot auto boot process and enter the following command to erase the NAND environment variables:

```
u-boot :> nand erase 0x260000 0
```

Note! If you want to recreate the full SD card with a separate partition for the EZSDK installer and the CCSv5 installer execute the following:

```
host $ sudo ${EZSDK}/bin/mkksdboot.sh --device /dev/sdb --sdk ${EZSDK} \
/path/to/ezsdk_dm814x-evm_5_xx_xx_xx_xx_setuplinux setup_CCS_5.x.x.xxxxx.tar.gz
```

This takes significant extra time so it's not part of the default instructions.

How to copy boot loaders to NAND flash

Please refer the U-boot documentation under the psp folder in your EZ SDK installation for the procedure required for copying boot loaders (MLO and u-boot) on NAND flash.

How to change the display resolution

The EZ SDK supports multiple displays resolutions but by default boots with 720p60 resolution. To change the resolution on your display, you can execute the following command. The command below demonstrates resolution change to 1080p60. In a similar manner, the resolution can be set to 720p60, 1080i60, 1080p30 and 1080p60.

```
target # cd /usr/share/ti/ti-media-controller-utils
target # ./change_resolution.sh 1080p60
```

Note! You will need to reboot your board after executing the above command.

How to change the display from LCD to HDMI

The EZ SDK supports multiple displays but by default displays on the LCD. To change the display to HDMI , you can execute the following command. In a similar manner, the display can be changed back to LCD.

```
target # cd /usr/share/ti/ti-media-controller-utils
target # ./change_display.sh hdmi
```

Note! You will need to reboot your board after executing the above command.

FAQ

Frequently Asked Questions on The EZ SDK are available at [[/index.php/EZ_SDK_FAQ](#) EZ SDK FAQ]. This information is also located in the *docs/* folder along with other documents.

License

THE WORK (AS DEFINED BELOW) IS PROVIDED UNDER THE TERMS OF THIS CREATIVE COMMONS PUBLIC LICENSE ("CCPL" OR "LICENSE"). THE WORK IS PROTECTED BY COPYRIGHT AND/OR OTHER APPLICABLE LAW. ANY USE OF THE WORK OTHER THAN AS AUTHORIZED UNDER THIS LICENSE OR COPYRIGHT LAW IS PROHIBITED. BY EXERCISING ANY RIGHTS TO THE WORK PROVIDED HERE, YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS LICENSE. TO THE EXTENT THIS LICENSE MAY BE CONSIDERED TO BE A CONTRACT, THE LICENSOR GRANTS YOU THE RIGHTS CONTAINED HERE IN CONSIDERATION OF YOUR ACCEPTANCE OF SUCH TERMS AND CONDITIONS.

License

1. Definitions

- a. **"Adaptation"** means a work based upon the Work, or upon the Work and other pre-existing works, such as a translation, adaptation, derivative work, arrangement of music or other alterations of a literary or artistic work, or phonogram or performance and includes cinematographic adaptations or any other form in which the Work may be recast, transformed, or adapted including in any form recognizably derived from the original, except that a work that constitutes a Collection will not be considered an Adaptation for the purpose of this License. For the avoidance of doubt, where the Work is a musical work, performance or phonogram, the synchronization of the Work in timed-relation with a moving image ("synching") will be considered an Adaptation for the purpose of this License.
- b. **"Collection"** means a collection of literary or artistic works, such as encyclopedias and anthologies, or performances, phonograms or broadcasts, or other works or subject matter other than works listed in Section 1(f) below, which, by reason of the selection and arrangement of their contents, constitute intellectual creations, in which the Work is included in its entirety in unmodified form along with one or more other contributions, each constituting separate and independent works in themselves, which together are assembled into a collective whole. A work that constitutes a Collection will not be considered an Adaptation (as defined below) for the purposes of this License.
- c. **"Creative Commons Compatible License"** means a license that is listed at <http://creativecommons.org/compatiblelicenses> that has been approved by Creative Commons as being essentially equivalent to this License, including, at a minimum, because that license: (i) contains terms that have the same purpose, meaning and effect as the License Elements of this License; and, (ii) explicitly permits the relicensing of adaptations of works made available under this License under the Creative Commons jurisdiction license with the same License Elements as this License.
- d. **"Distribute"** means to make available to the public the original and copies of the Work or Adaptation, as appropriate, through sale or other transfer of ownership.
- e. **"License Elements"** means the following high-level license attributes as selected by Licensor and indicated in the title of this License: Attribution, ShareAlike.
- f. **"Licensor"** means the individual, individuals, entity or entities that offer(s) the Work under the terms of this License.
- g. **"Original Author"** means, in the case of a literary or artistic work, the individual, individuals, entity or entities who created the Work or if no individual or entity can be identified, the publisher; and in addition (i) in the case of a performance the actors, singers, musicians, dancers, and other persons who act, sing, deliver, declaim, play in, interpret or otherwise perform literary or artistic works or expressions of folklore; (ii) in the case of a phonogram the producer being the person or legal entity who first fixes the sounds of a performance or other sounds; and, (iii) in the case of broadcasts, the organization that transmits the broadcast.
- h. **"Work"** means the literary and/or artistic work offered under the terms of this License including without limitation any production in the literary, scientific and artistic domain, whatever may be the mode or form of its expression including digital form, such as a book, pamphlet and other writing; a lecture, address, sermon or other work of the same nature; a dramatic or dramatico-musical work; a choreographic work or entertainment in dumb show; a musical composition with or without words; a cinematographic work to which are assimilated works expressed by a process analogous to cinematography; a work of drawing, painting, architecture, sculpture, engraving or lithography; a photographic work to which are assimilated works expressed by a process analogous to photography; a work of applied art; an illustration, map, plan, sketch or three-dimensional work relative to geography, topography, architecture or science; a performance; a broadcast; a phonogram; a compilation of data to the extent it is protected as a copyrightable work; or a work performed by a variety or circus performer to the extent it is not otherwise considered a literary or artistic work.
- i. **"You"** means an individual or entity exercising rights under this License who has not previously violated the terms of this License with respect to the Work, or who has received express permission from the Licensor to exercise rights under this License despite a previous violation.
- j. **"Publicly Perform"** means to perform public recitations of the Work and to communicate to the public those public recitations, by any means or process, including by wire or wireless means or public digital performances; to make available to the public Works in such a way that members of the public may access these Works from a place and at a place individually chosen by them; to perform the Work to the public by any means or process and the communication to the public of the performances of the Work, including by public digital performance; to broadcast and rebroadcast the Work by any means including signs, sounds or images.
- k. **"Reproduce"** means to make copies of the Work by any means including without limitation by sound or visual recordings and the right of fixation and reproducing fixations of the Work, including storage of a protected performance or phonogram in digital form or other electronic medium.

2. Fair Dealing Rights

Nothing in this License is intended to reduce, limit, or restrict any uses free from copyright or rights arising from limitations or exceptions that are provided for in connection with the copyright protection under copyright law or other applicable laws.

3. License Grant

Subject to the terms and conditions of this License, Licensor hereby grants You a worldwide, royalty-free, non-exclusive, perpetual (for the duration of the applicable copyright) license to exercise the rights in the Work as stated below:

- a. to Reproduce the Work, to incorporate the Work into one or more Collections, and to Reproduce the Work as incorporated in the Collections;
- b. to create and Reproduce Adaptations provided that any such Adaptation, including any translation in any medium, takes reasonable steps to clearly label, demarcate or otherwise identify that changes were made to the original Work. For example, a translation could be marked "The original work was translated from English to Spanish," or a modification could indicate "The original work has been modified.";
- c. to Distribute and Publicly Perform the Work including as incorporated in Collections; and,
- d. to Distribute and Publicly Perform Adaptations.
- e. For the avoidance of doubt:
- i. **Non-waivable Compulsory License Schemes.** In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme cannot be waived, the Licensor reserves the exclusive right to collect such royalties for any exercise by You of the rights granted under this License;
- ii. **Waivable Compulsory License Schemes.** In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme can be waived, the Licensor waives the exclusive right to collect such royalties for any exercise by You of the rights granted under this License; and,
- iii. **Voluntary License Schemes.** The Licensor waives the right to collect royalties, whether individually or, in the event that the Licensor is a member of a collecting society that administers voluntary licensing schemes, via that society, from any exercise by You of the rights granted under this License.

The above rights may be exercised in all media and formats whether now known or hereafter devised. The above rights include the right to make such modifications as are technically necessary to exercise the rights in other media and formats. Subject to Section 8(f), all rights not expressly granted by Licensor are hereby reserved.

4. Restrictions

The license granted in Section 3 above is expressly made subject to and limited by the following restrictions:

- a. You may Distribute or Publicly Perform the Work only under the terms of this License. You must include a copy of, or the Uniform Resource Identifier (URI) for, this License with every copy of the Work You Distribute or Publicly Perform. You may not offer or impose any terms on the Work that restrict the terms of this License or the ability of the recipient of the Work to exercise the rights granted to that recipient under the terms of the License. You may not sublicense the Work. You must keep intact all notices that refer to this License and to the disclaimer of warranties with every copy of the Work You Distribute or Publicly Perform. When You Distribute or Publicly Perform the Work, You may not impose any effective technological measures on the Work that restrict the ability of a recipient of the Work from You to exercise the rights granted to that recipient under the terms of the License. This Section 4(a) applies to the Work as incorporated in a Collection, but this does not require the Collection apart from the Work itself to be made subject to the terms of this License. If You create a Collection, upon notice from any Licensor You must, to the extent practicable, remove from the Collection any credit as required by Section 4(c), as requested. If You create an Adaptation, upon notice from any Licensor You must, to the extent practicable, remove from the Adaptation any credit as required by Section 4(c), as requested.
- b. You may Distribute or Publicly Perform an Adaptation only under the terms of: (i) this License; (ii) a later version of this License with the same License Elements as this License; (iii) a Creative Commons jurisdiction license (either this or a later license version) that contains the same License Elements as this License (e.g., Attribution-ShareAlike 3.0 US); (iv) a Creative Commons Compatible License. If you license the Adaptation under one of the licenses mentioned in (iv), you must comply with the terms of that license. If you license the Adaptation under the terms of any of the licenses mentioned in (i), (ii) or (iii) (the "Applicable License"), you must comply with the terms of the Applicable License generally and the following provisions: (I) You must include a copy of, or the URI for, the Applicable License with every copy of each Adaptation You Distribute or Publicly Perform; (II) You may not offer or impose any terms on the Adaptation that restrict the terms of the Applicable License or the ability of the recipient of the Adaptation to exercise the rights granted to that recipient under the terms of the Applicable License; (III) You must keep intact all notices that refer to the Applicable License and to the disclaimer of warranties with every copy of the Work as included in the Adaptation You Distribute or Publicly Perform; (IV) when You Distribute or Publicly Perform the Adaptation, You may not impose any effective technological measures on the Adaptation that restrict the ability of a recipient of the Adaptation from You to exercise the rights granted to that recipient under the terms of the Applicable License. This Section 4(b) applies to the Adaptation as incorporated in a Collection, but this does not require the Collection apart from the Adaptation itself to be made subject to the terms of the Applicable License.
- c. If You Distribute, or Publicly Perform the Work or any Adaptations or Collections, You must, unless a request has been made pursuant to Section 4(a), keep intact all copyright notices for the Work and provide, reasonable to the medium or means You are utilizing: (i) the name of the Original Author (or pseudonym, if applicable) if supplied, and/or if the Original Author and/or Licensor designate another party or parties (e.g., a sponsor institute, publishing entity, journal) for attribution ("Attribution Parties") in Licensor's copyright notice, terms of service or by other reasonable means, the name of such party or parties; (ii) the title of the Work if supplied; (iii) to the extent reasonably practicable, the URI, if any, that Licensor specifies to be associated with the Work, unless such URI does not refer to the copyright notice or licensing information for the Work; and (iv) , consistent with Section 3(b), in the case of an Adaptation, a credit identifying the use of the Work in the Adaptation (e.g., "French translation of the Work by Original Author," or "Screenplay based on original Work by Original Author"). The credit required by this Section 4(c) may be implemented in any reasonable manner; provided, however, that in the case of a Adaptation or Collection, at a minimum such credit will appear, if a credit for all contributing authors of the Adaptation or Collection appears, then as part of these credits and in a manner at least as prominent as the credits for the other contributing authors. For the avoidance of doubt, You may only use the credit required by this Section for the purpose of attribution in the manner set out above and, by exercising Your rights under this License. You may not implicitly or explicitly assert or imply any connection with, sponsorship or endorsement by the Original Author, Licensor and/or Attribution Parties, as appropriate, of You or Your use of the Work, without the separate, express prior written permission of the Original Author, Licensor and/or Attribution Parties.
- d. Except as otherwise agreed in writing by the Licensor or as may be otherwise permitted by applicable law, if You Reproduce, Distribute or Publicly Perform the Work either by itself or as part of any Adaptations or Collections, You must not distort, mutilate, modify or take other derogatory action in relation to the Work which would be prejudicial to the Original Author's honor or reputation. Licensor agrees that in those jurisdictions (e.g. Japan), in which any exercise of the right granted in Section 3(b) of this License (the right to make Adaptations) would be deemed to be a distortion, mutilation, modification or other derogatory action prejudicial to the Original Author's honor and reputation, the Licensor will waive or not assert, as appropriate, this Section, to the fullest extent permitted by the applicable national law, to enable You to reasonably exercise Your right under Section 3(b) of this License (right to make Adaptations) but not otherwise.

5. Representations, Warranties and Disclaimer

UNLESS OTHERWISE MUTUALLY AGREED TO BY THE PARTIES IN WRITING, LICENSOR OFFERS THE WORK AS-IS AND MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND CONCERNING THE WORK, EXPRESS, IMPLIED, STATUTORY OR OTHERWISE, INCLUDING, WITHOUT LIMITATION, WARRANTIES OF TITLE, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NONINFRINGEMENT, OR THE ABSENCE OF LATENT OR OTHER DEFECTS, ACCURACY, OR THE PRESENCE OF ABSENCE OF ERRORS, WHETHER OR NOT DISCOVERABLE. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES, SO SUCH EXCLUSION MAY NOT APPLY TO YOU.

6. Limitation on Liability

EXCEPT TO THE EXTENT REQUIRED BY APPLICABLE LAW, IN NO EVENT WILL LICENSOR BE LIABLE TO YOU ON ANY LEGAL THEORY FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES ARISING OUT OF THIS LICENSE OR THE USE OF THE WORK, EVEN IF LICENSOR HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. Termination

- a. This License and the rights granted hereunder will terminate automatically upon any breach by You of the terms of this License. Individuals or entities who have received Adaptations or Collections from You under this License, however, will not have their licenses terminated provided such individuals or entities remain in full compliance with those licenses. Sections 1, 2, 5, 6, 7, and 8 will survive any termination of this License.
- b. Subject to the above terms and conditions, the license granted here is perpetual (for the duration of the applicable copyright in the Work). Notwithstanding the above, Licensor reserves the right to release the Work under different license terms or to stop distributing the Work at any time; provided, however that any such election will not serve to withdraw this License (or any other license that has been, or is required to be, granted under the terms of this License), and this License will continue in full force and effect unless terminated as stated above.

8. Miscellaneous

- a. Each time You Distribute or Publicly Perform the Work or a Collection, the Licensor offers to the recipient a license to the Work on the same terms and conditions as the license granted to You under this License.
- b. Each time You Distribute or Publicly Perform an Adaptation, Licensor offers to the recipient a license to the original Work on the same terms and conditions as the license granted to You under this License.
- c. If any provision of this License is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this License, and without further action by the parties to this agreement, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.
- d. No term or provision of this License shall be deemed waived and no breach consented to unless such waiver or consent shall be in writing and signed by the party to be charged with such waiver or consent.
- e. This License constitutes the entire agreement between the parties with respect to the Work licensed here. There are no understandings, agreements or representations with respect to the Work not specified here. Licensor shall not be bound by any additional provisions that may appear in any communication from You. This License may not be modified without the mutual written agreement of the Licensor and You.
- f. The rights granted under, and the subject matter referenced, in this License were drafted utilizing the terminology of the Berne Convention for the Protection of Literary and Artistic Works (as amended on September 28, 1979), the Rome Convention of 1961, the WIPO Copyright Treaty of 1996, the WIPO Performances and Phonograms Treaty of 1996 and the Universal Copyright Convention (as revised on July 24, 1971). These rights and subject matter take effect in the relevant jurisdiction in which the License terms are sought to be enforced according to the corresponding provisions of the implementation of those treaty provisions in the applicable national law. If the standard suite of rights granted under applicable copyright law includes additional rights not granted under this License, such additional rights are deemed to be included in the License; this License is not intended to restrict the license of any rights under applicable law.
