# DPS Software Library & Header Files

## Today's DPSLib components:

- ePWM Demonstration                   SPRC228
- HRPWM Demonstration                SPRC227
- DC/DC Buck Converter                SPRC229
- DC/AC Single Phase Inverter        SPRC303
- Two-phase PFC                        SPRC307
- DC/DC Phase-shifted Full-Bridge    SPRC311

\* Will all roll into controlSuites

Visit [www.ti.com/dpslib](http://www.ti.com/dpslib) for above library s/w and link to the h/w platforms

## C2000 header files Simplify peripheral init. and other functions, takes care of register defs

- Header file package consists of:
  - \DSP280x\_headers\include → .h files
  - \DSP280x\_common\src → .c source files
  - \DSP280x\_headers\cmd → linker command files
  - \DSP280x\_headers\gel → .gel files for CCS
  - \DSP280x\_examples → example programs
  - \doc → documentation

Visit [www.ti.com/c2000getstarted](http://www.ti.com/c2000getstarted)

## Free On-line Training

# Build Options & CGT Documents

The screenshot shows the 'Configuration Settings' dialog box for the C2000 Compiler. The 'Tool Settings' tab is active, and the 'C2000 Compiler' section is expanded. The 'Runtime Model Options' sub-section is selected, showing the following options:

- Pipeline protect volatiles by <nops> nops (C27x) [def: 2] (--protect\_volatile, -mv) [ ]
- Optimize fully in the presence of debug directives (--optimize\_with\_debug, -mn)
- Allow reassociation of sat arithmetic (--sat\_reassoc) [ ]
- Assembler fill value for data section (--asm\_data\_fill) [ ]
- Compile for power profiling (--profile:power)
- Disable C28x fast branch instructions (--no\_fast\_branch, -me)
- Use large memory model (--large\_memory\_model, -ml)
- Unified memory (--unified\_memory, -mt)
- Don't generate RPT instructions (--no\_rpt, -mi)
- Allow reassociation of FP arithmetic (--fp\_reassoc) [ ]
- Place each function in a separate subsection (--gen\_func\_subsections, -mo)
- Assembler fill value for code section (--asm\_code\_fill) [ ]
- C2XLP source compatibility (--c2xlp\_src\_compatible, -m20)
- Optimize for speed (--opt\_for\_speed, -mf) [ ]
- No DP load optimization (--disable\_dp\_load\_opt, -md)
- Specify CLA support (--cla\_support) [ cla0 ]
- Specify floating point support (--float\_support) [ ]
- Specify max number of repetitions in a RPT instruction (--rpt\_threshold) [0-256] [ ]
- Optimize for code size (--opt\_for\_space, -ms)

SPRU513

SPRU514

# H/W Design Suggestion

## 1. DS Chapter 2 & 6

### 2.2 Signal Descriptions

Table 2-2 describes the signals. With the exception of the JTAG pins, the GPIO function is the default at reset, unless otherwise mentioned. The peripheral signals that are listed under them are alternate

Table 2-2. Terminal Functions<sup>(1)</sup>

TERMINAL				I/O/Z	DESCRIPTION
NAME	PN PIN #	PAG PIN #	RSH PIN #		
<b>JTAG</b>					
$\overline{\text{TRST}}$	10	8	6	I	JTAG test reset with internal pulldown. $\overline{\text{TRST}}$ , when driven high, gives the scan system control of the operations of the device. If this signal is not connected or driven low, the device operates in its functional mode, and the test reset signals are ignored. <b>NOTE:</b> $\overline{\text{TRST}}$ is an active high test pin and must be maintained low at all times during normal device operation. An external pull-down resistor is required on this pin. The value of this resistor should be based on drive strength of the debugger pods applicable to the design. A 2.2-k $\Omega$ resistor generally offers adequate protection. Since this is application-specific, it is recommended that each target board be validated for proper operation of the debugger and the application. (↓)
TCK	See GPIO38			I	See GPIO38. JTAG test clock with internal pullup. (↑)

## 2. Hardware Design Guidelines for TMS320F28xx and TMS320F28xxx DSCs (Rev. A): spraas1b

## 3. ControlCARD schematic

# Vdd / Vss in Piccolo

Table 2-2. Terminal Functions <sup>(1)</sup> (continued)

TERMINAL			I/O/Z	DESCRIPTION
NAME	PN PIN #	PAG PIN #		
CPU AND I/O POWER				
V <sub>DDA</sub>	20	16		Analog Power Pin. Tie with a 2.2- $\mu$ F capacitor (typical) close to the pin.
V <sub>SSA</sub>	21	17		Analog Ground Pin. NOTE: VREFLO is always connected to V <sub>SSA</sub> on the 64-pin PAG device.
V <sub>DD</sub>	7	5		CPU and Logic Digital Power Pins – no supply source needed when using internal VREG. Tie with 1.2 $\mu$ F (minimum) ceramic capacitor (10% tolerance) to ground when using internal VREG. Higher value capacitors may be used, but could impact supply-rail ramp-up time.
V <sub>DD</sub>	54	43		
V <sub>DD</sub>	72	59		
V <sub>DDIO</sub>	36	29		Digital I/O and Flash Power Pin – Single Supply source when VREG is enabled
V <sub>DDIO</sub>	70	57		
V <sub>SS</sub>	8	6		Digital Ground Pins
V <sub>SS</sub>	35	28		
V <sub>SS</sub>	53	42		
V <sub>SS</sub>	71	58		

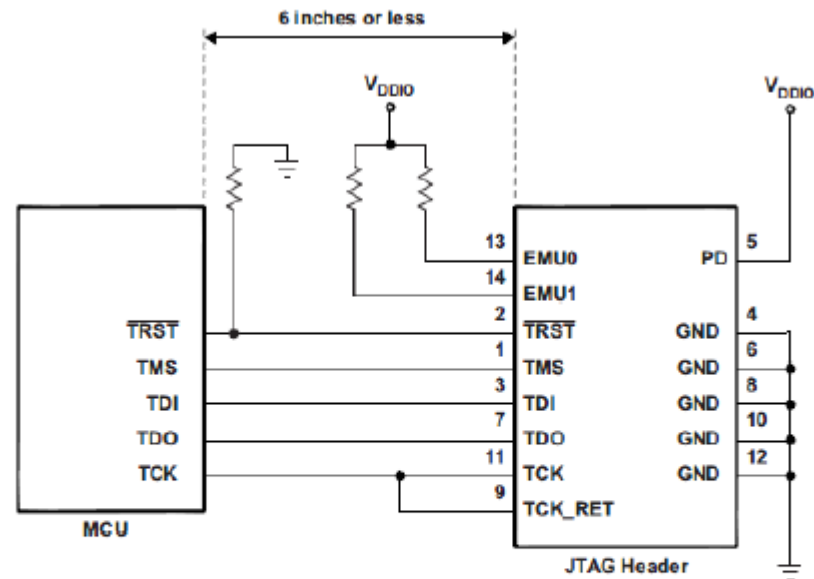

## Release 0.2

# Piccolo JTAG Connection

1. EMU0/1 pull-up, TRST pull-down
2. JTAG multiplexing with GPIO
3. 300nf~1pf capacitor for EMC/EMI

See [Figure 4-16](#) for JTAG/GPIO multiplexing.

**Figure 6-4. Emulator Connection Without Signal Buffering for the MCU**

## NOTE

The 2803x devices do not have EMU0/EMU1 pins. For designs that have a JTAG Header on-board, the EMU0/EMU1 pins on the header must be tied to  $V_{DDIO}$  through a 4.7-k $\Omega$  (typical) resistor.

# CCS fails to connect with target

- Target device?
- Power on?
- CCS support?
- JTAG hardware design & continuity?
- Oscillator works?
- Reset signal normal?
- Emulator type & vendor?
- Swap test?

# CSM / Device Locked

1. New device with no password (password is 0xFFFFFFFF).
2. Device will be locked permanently if password is programmed to 0x00000000.
3. User must remember its password.
4. Don't power down or cancel the procedure when flash programming is going on.
5. Don't solder the chip to board with high-temp for long time.
6. Make sure the power stability.
7. Flash memory is not easy to fail.

# Boot Mode

1. Make sure the boot pins are set to the right status.
2. It's better don't add external circuit.
3. For standalone system which is boot to flash, check these pins are connect to high or left unconnected.
4. These GPIO can be used normally after boot to the right mode.

**Table 3-6. Boot Mode Selection**

MODE	GPIO37/TDO	GPIO34/COMP2OUT/ COMP3OUT	$\overline{\text{TRST}}$	MODE
3	1	1	0	GetMode
2	1	0	0	Wait (see <a href="#">Section 3.3.10</a> for description)
1	0	1	0	SCI
0	0	0	0	Parallel IO
EMU	x	x	1	Emulation Boot

# Codes run in RAM

Why codes need to run in RAM?

1. Flash setup code must run in RAM
2. Time critical code run in RAM can improve efficiency

To find code example in

C:\tidcs\c28\DSP2803x\v121\DSP2803x\_examples\flash\Example\_2803xFlash.pjt

Main.c:

```
#pragma CODE_SECTION(InitFlash, "ramfuncs");
```

```
MemCopy(&RamfuncsLoadStart, &RamfuncsLoadEnd, &RamfuncsRunStart);
```

```
// Call Flash Initialization to setup flash waitstates
```

```
// This function must reside in RAM
```

```
InitFlash();
```

F28035.cmd:

```
ramfuncs : LOAD = FLASHD,
```

```
RUN = RAML0,
```

```
LOAD_START(_RamfuncsLoadStart),
```

```
LOAD_END(_RamfuncsLoadEnd),
```

```
RUN_START(_RamfuncsRunStart),
```

```
PAGE = 0
```

# Piccolo ADC

It's indicated in silicon errata, and will be fixed in Rev. A.

<b>Advisory</b>	<b><i>ADC: Initial Conversion</i></b>
<b>Revision(s) Affected</b>	0
<b>Details</b>	When the ADC conversions are initiated by any source of trigger, the first sample may not be the correct conversion result.
<b>Workaround(s)</b>	Discard the first sample at the beginning of every series of conversions. For instance, if the application calls for a given series of conversions, SOC0→SOC1→SOC2, to initiate periodically, then setup the series instead as SOC0→SOC1→SOC2→SOC3 and only use the last three conversions, ADCRESULT1, ADCRESULT2, ADCRESULT3, thereby discarding ADCRESULT0.  User application should validate if this workaround is acceptable in their application.

<b>Advisory</b>	<b><i>ADC: DC Specifications: Linearity Limitation</i></b>
<b>Revision(s) Affected</b>	0
<b>Details</b>	The linearity degrades with increasing temperature in the upper half of the transfer function.
<b>Workaround(s)</b>	The impact from this limitation will be addressed in the next revision (revision A) of the silicon. The following features will be added: <ol style="list-style-type: none"><li>1. ADC clock divider-by-2 enable bit. At 60 MHz, effective sample rate will be 2.3 MSPS. This offers 30-MHz ADC and 60-MHz system clock, and improves linearity.</li><li>2. A non-pipeline mode enable bit will be available that offers 3 MSPS at 60-MHz ADC clock with linearity specifications better than can be obtained in the pipeline mode.</li><li>3. Existing pipeline mode with 4.6 MSPS at 60-MHz system clock will have improved linearity compared to revision 0 silicon.</li></ol> Details of enabling Options 1 and 2 will be released in future documentation along with the revision A device.

# Piccolo Internal Oscillator & Temp Sensor

On-chip Temp sensor helps to Calibrate

1. Analyze thermal behavior of the device in Application set up
2. Analyze package thermal model with different PCB and board/system design
3. On-chip Oscillator for CAN communications for 1% range
4. Control PWM clock period when using HRPWM resolution
5. Control communication speeds in SCI or SPI, if desired.

To find application note on it:

1. Oscillator Compensation Guide (SPRAB84A )
2. Piccolo MCU CAN Module Operation Using the On-Chip Zero-Pin Oscillator (SPRABI7)

**Table 6-5. Internal Zero-Pin Oscillator (INTOSC1/INTOSC2) Characteristics**

PARAMETER		MIN	TYP	MAX	UNIT
Internal zero-pin oscillator 1 (INTOSC1) <sup>(1)(2)</sup>	$t_{d(ZPOSC1)}$ , Cycle time	97.09	100	103.09	ns
	Frequency	9.7	10	10.3	MHz
Internal zero-pin oscillator 2 (INTOSC2) <sup>(1)(2)</sup>	$t_{d(ZPOSC2)}$ , Cycle time	97.09	100	103.09	ns
	Frequency	9.7	10	10.3	MHz
Step size (coarse trim)			55		kHz
Step size (fine trim)			14		kHz
Temperature drift <sup>(3)</sup>			3		kHz/°C
Voltage ( $V_{DD}$ ) drift <sup>(3)</sup>			175		Hz/mV

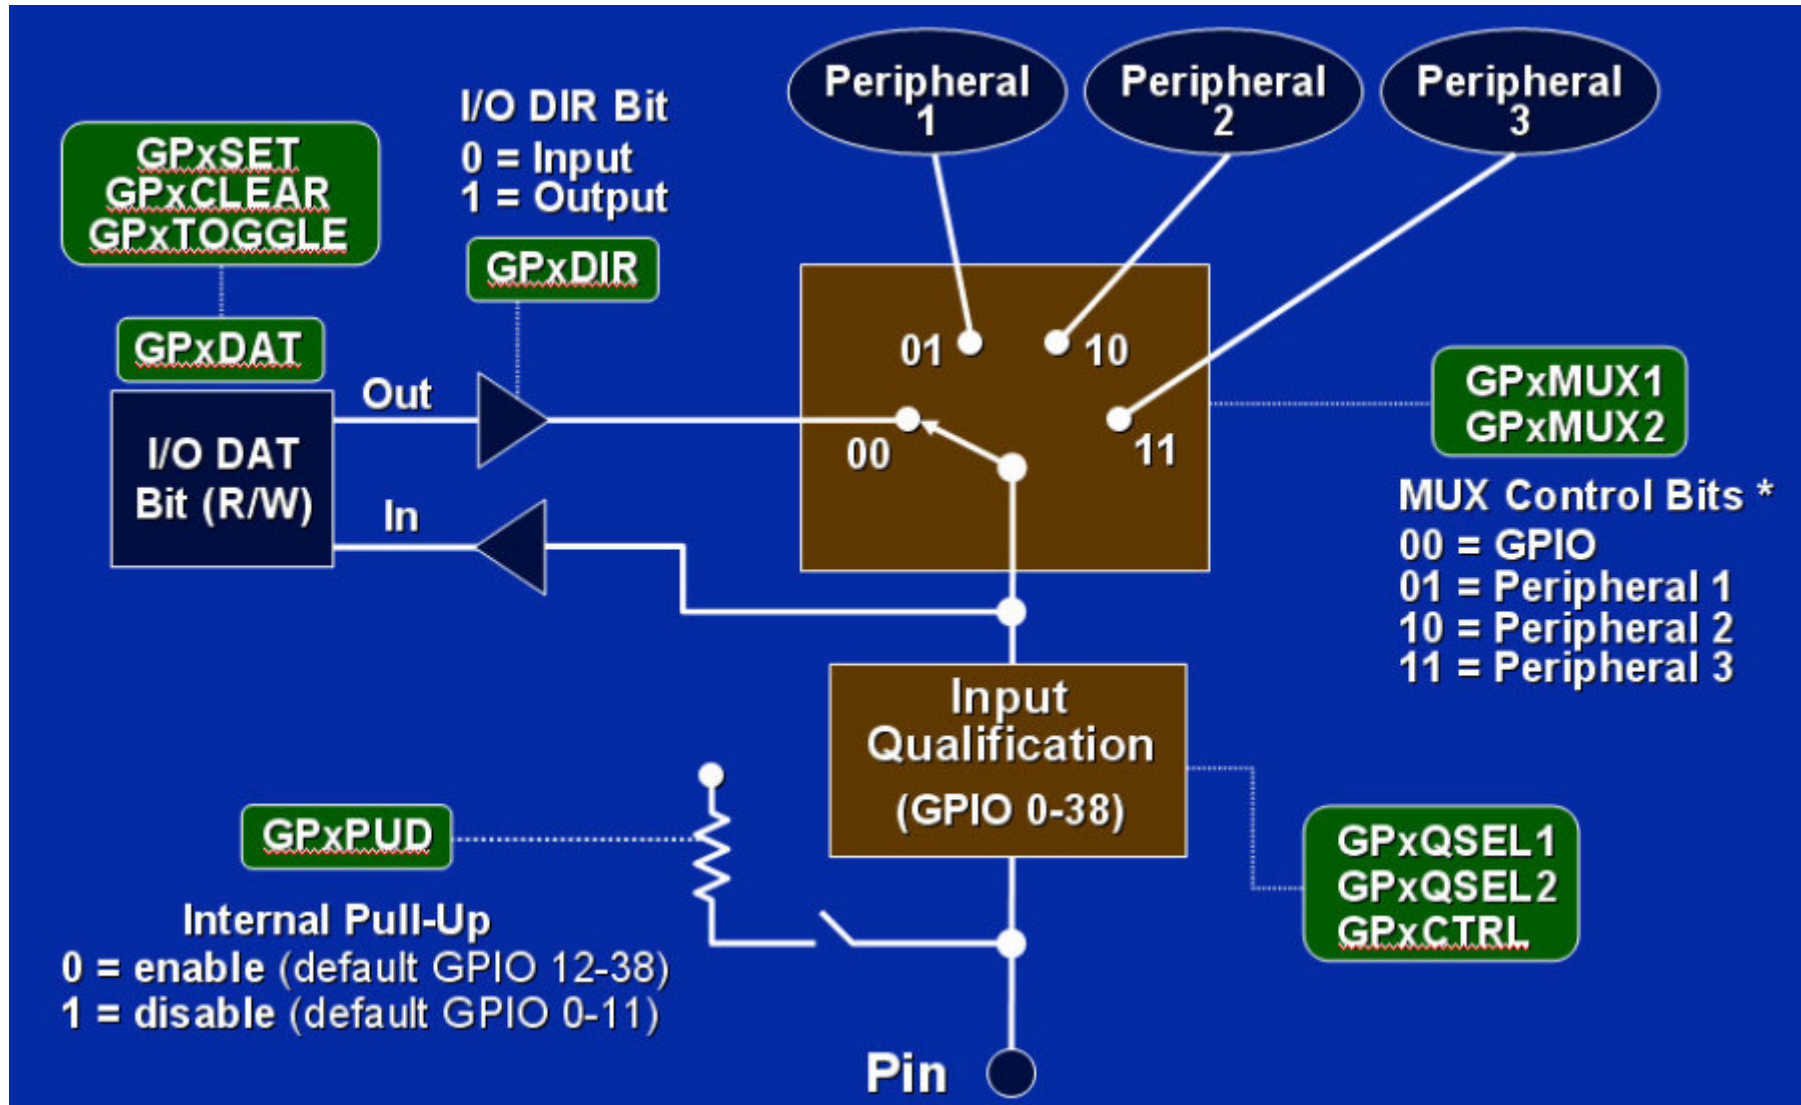

(1) In order to achieve better oscillator accuracy (10 MHz  $\pm$  1% or better) than shown, refer to the oscillator calibration example in *2803x C/C++ Header Files and Peripheral Examples* (literature number [SPRC892](#)), and the *Oscillator Compensation Guide Application Report* (literature number [SPRAB84](#)).

(2) Frequency range ensured only when VREG is enabled,  $\overline{VREGENZ} = V_{SS}$ .

(3) Output frequency of the internal oscillators follows the direction of both the temperature gradient and voltage ( $V_{DD}$ ) gradient. For example:

- Increase in temperature will cause the output frequency to increase per the temperature coefficient.
- Decrease in voltage ( $V_{DD}$ ) will cause the output frequency to decrease per the voltage coefficient.

# Output GPIO Hi/Lo with SET/CLEAR

# XINTF Difference Between F281x and F2833x

Initial XINTF in DSP2833x\_CodeStartBranch.asm if external RAM used.

	F2833x	F281x
<b>1.Data Bus Width</b>	16-bit or 32-bit	16-bit
<b>2.Address Bus Reach</b>	20bit 1M*16bit	19bit 512k*16bit
<b>3.Direct Memory Access</b>	DMA access	not include DMA
<b>4.XINTF Clock Enable</b>	dedicated control	always enable
<b>5.XINTF Pin Muxing</b>	MUXed with GPIO	dedicated pins
<b>6.NO.of Zones&amp;Chip Select Signals</b>	Zone 0、 6、 7	Zone 0 1、 2、 6 7
<b>7.Zone7 Memory Mapping</b>	Zone6 7 not share	Zone 7 mirror 6
<b>8.Zone Memory Loactions</b>	Zone 0 4k*16bit	Zone 0 8k*16bit
<b>9.EALLOW protection</b>	EALLOW protect	not

# Flash Programming with Plug-In

The screenshot shows the 'On-Chip Flash Programmer' window with the following settings:

- Clock Configuration:** OSCCLK (Mhz): 10, DIVSEL: /2, PLLCR Value: 12, SYSCLOCKOUT (MHz): 60.0000
- Erase Sector Selection:** All sectors A through J are checked.
- Code Security Password:** Keys 0 through 7 are all set to FFFF.
- Operation:** 'Erase, Program, Verify' is selected. The COFF file path is 'C:\C28x\Labs\Example\Debug\Example.out'. Other options include 'Erase Only', 'Program, Verify', 'Program Only', 'Verify Only', 'Depletion Recovery', and 'Frequency Test'. Wait states are set to 15 for Flash Random, Flash Page, and 31 for OTP.
- Register and Pin:** Register is 'GPAMux' and Pin is 'GPIO0 (A)'. There are also fields for 'Flash', 'OTP', and 'Flash+OTP'.
- Buttons:** 'Execute Operation', 'Help...', 'Unlock', 'Lock', 'Program Password', and 'Flash Programmer Settings...'.

**Q & A**

**Thanks!**
